## Case Study

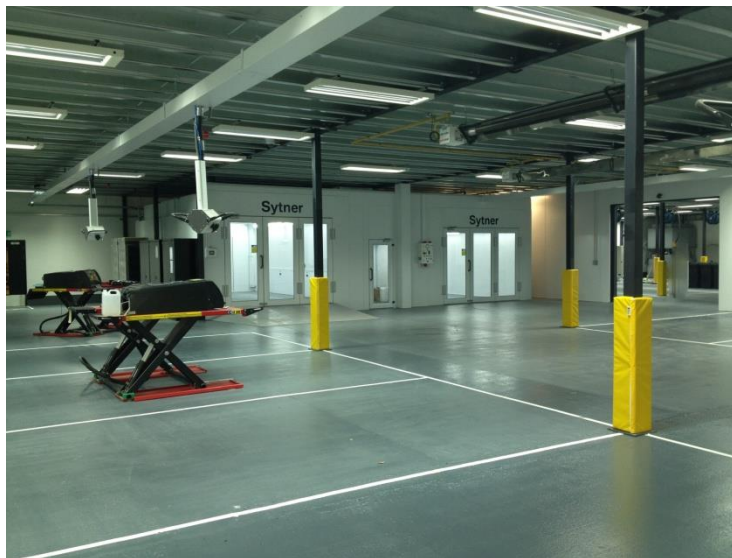

### LINCO INSTALLS A NEW CAR STORAGE SOLUTION AT SYTNER MINI SLOUGH

Having successfully installed a working solution for Sytner BMW Nottingham we were once again tasked with coming up with a solution for Sytner's new Mini Dealership in Slough.

Sytner required the Storage of 80 Mini's at their new dealership, but without the ground space to provide enough parking bays, we were tasked with providing a solution to use the height of the building.

With space being a premium Linco also had to come up with a solution of getting the Car from ground floor to first floor without a traditional ramp.

What was unique about the project unlike Nottingham was that the ground floor was expected to be a working area for Mechanics, Body Shop, Paint Ovens and Valeting. Therefore the Column Grid was vital to the success of the project.

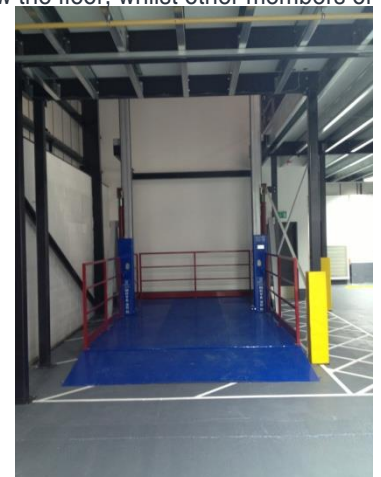

Once again Linco used its depth and strength of knowledge and experience to provide a workable solution. As with the previous project at Nottingham our solution had to be dismantlable and reusable.

We once more completed the installation with the addition of Barriers (High Visibility) and Bay Markings and Column Protection Bumpers.

Our team set about designing the Column Grid to suit the work space below the floor, whilst other members of the team researched and tested decking suitable for the environment.

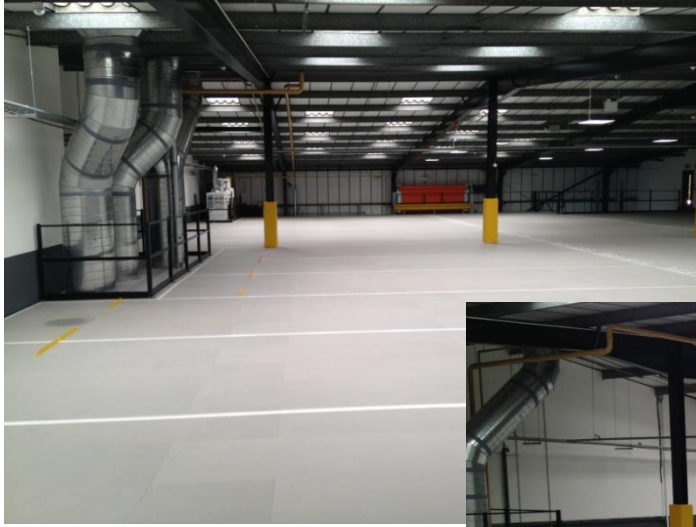

Again we provided a specialist decking capable of accommodating the cars whilst light enough not to impede the weight loading of the Mezzanine Floor itself.

The final piece of the 'Jigsaw' for Linco was provide a solution to enable the cars to get from ground floor to first floor without a ramp. On this occasion we opted to install a specialist car lift, which used only ONE car parking space on the ground and first floor.

## Case Study

### FACTS:

1,000sm<sup>2</sup>/q Storage Space  
Storage Capacity of 80 Cars  
Compliance with Building Regulations  
and Fire Regulations  
Traditional Mezzanine Floor  
Construction  
Dismountable and Reusable  
Built 2012

The whole project was completed from start to finish in just 6 weeks and on time and on budget. As a solution the project was 50% of the cost of a steel and concrete solution and obviously a great deal less than obtaining additional car storage off site, but the biggest benefit is the dynamic ability of being able to dismantle and reuse the Mezzanine either as a Car Storage Solution or a Standard Mezzanine Floor.
